The Leading Manufacturer of Air Compressors  
for the Fire Protection Industry

## CDF2000

### Automatic Float Drain for Condensate Removal

#### Description and Performance

General Air Products' CDF2000 is an automatic drain composed of an aluminum body that contains a stainless steel float operated purging system. It is also equipped with a manual purging valve. It discharges the condensate (not the compressed air) automatically.

As the condensate level rises the float rises, opening the discharge orifice.

#### Installation

Before connecting the drain, blow compressed air through the piping in order to thoroughly clean out any impurities within it.

Install the CDF2000 on the drip leg. Install the optional connection nipple in order to allow air equalization. The connection of the drip leg to the nipple to the CDF2000 must be done without any extra pipe or filter.

Run the drain outlet to the proper drain or collection point according to your local requirements

#### Maintenance

**Yearly:** Dismantle the drain, and clean all components. Do not use solvents to clean rubber components.
